

ABSTRACT

Dynamic redirection of streaming media between computing devices is described. In an implementation, a method listening at an application programming interface for a notification indicating that a change is to be made in a topology of streaming media software components. When the notification is received, a media engine that is capable of reconfiguring the topology in accordance with the indicated change is notified. At least one of the topology or the reconfigured topology have one of the streaming media software components located on a computing device and another one of the streaming media software components located on another computing device.
